

1     **WHAT IS CLAIMED IS:**

- 2             1. A laryngeal mask airway having  
3             a dual-airway having  
4                 a primary tube used for inputting medical gas and having a  
5     bottom surface and a front end,  
6                 a secondary tube integrally mounted on the bottom surface of the  
7     primary tube and having  
8                 a rear end and a front end, and  
9                 an inflation balloon mounted on the secondary tube near the rear  
10    end of the secondary tube and communicates with the secondary tube,  
11             a back plate connected to the front end of the primary tube and having  
12                 a rear end connected to the front end of the primary tube,  
13                 a front end,  
14                 a side edge, and  
15                 a tongue integrally formed with and extending out from the front  
16    end of the back plate, and raising at a degree relative to the front end of the  
17    cover, and  
18             a laryngeal mask connected to the side edge of the back plate and  
19    having  
20             an opening defined in the laryngeal mask and communicating with  
21    the front end of the secondary tube.  
22             2. The laryngeal mask airway as claimed in claim 1, wherein the  
23    extended tongue of the back plate rises at about 7 degrees.
